Period 7

Lucas Long (solo)

Title: Chess on processing

Description

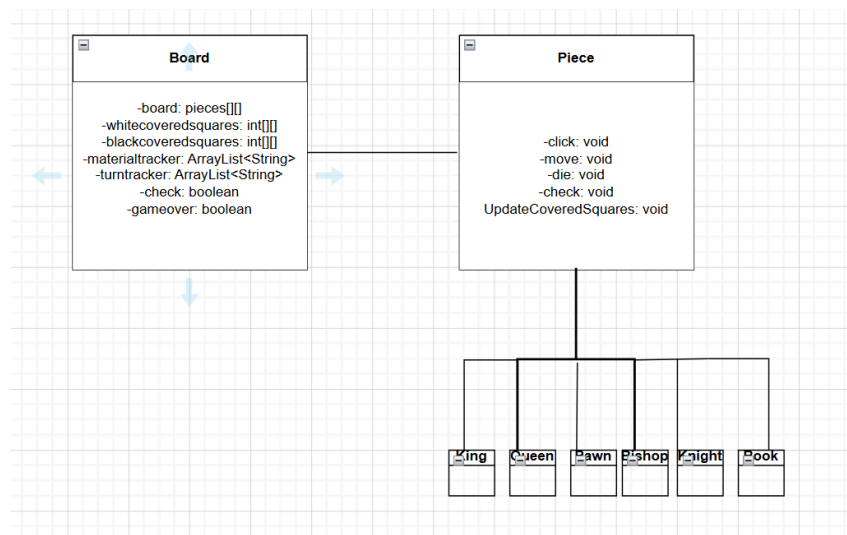

My project will be to recreate chess on processing, similar to how chess.com does it but without the engine. I might also make piece vision visible to the player to assist newer players.

Functionalities:

- chess board with movable pieces
- highlights for possible moves
- indicators for check and checkmate
- game and/or win counter
- board flipping

Libraries: none as of right now

UML diagram:

How does it work?

Two users will go onto the same device and drag and drop chess pieces following standard rules. If a person doesn't know how to play there will be a toggleable rules window.
